

# C-LEVEL

## The Ultimate Upgrade. Rocket fuel for your audio processor.

Want a new audio processor but can't get past the price? We have some great news! You can make your existing processor sound dramatically better by feeding it with a Chameleon C-LEVEL audio leveling processor.

C-LEVEL is a pre-processor. Insert it between the mixing console and the OTA (over the air) processor and prepare to be amazed. It's like having the perfect board operator getting all the elements exactly right every second of every show.

Like all Chameleon processors, C-LEVEL adapts to the incoming audio. All processing parameters are controlled dynamically by our Chameleon expert software. Not only does this eliminate the complexity associated with other audio processors, but more importantly, it delivers the most transparent, natural sounding audio you've ever heard.

A four-position rotary switch on the front panel allows you to select bypass, or from three different active settings. The 9:00 setting is the most transparent. We dare you to hear it! The 12:00 and 3:00 settings are more and most aggressive respectively. Choose the setting that gives you the sound you're seeking in combination with your OTA processor. Set it and forget it.
